This research uses data from Add Health, a program project directed by Kathleen Mullan Harris and designed by J. Richard Udry, Peter S. Bearman, and Kathleen Mullan Harris at the University of North Carolina at Chapel Hill, and funded by grant P01-HD31921 from the Eunice Kennedy Shriver National Institute of Child Health and Human Development, with cooperative funding from 23 other federal agencies and foundations. Special acknowledgment is due Ronald R. Rindfuss and Barbara Entwisle for assistance in the original design. Information on how to obtain the Add Health data files is available on the Add Health website (http://www.cpc.unc.edu/addhealth). No direct support was received from grant P01-HD31921 for this analysis.

Abstract: Adolescents’ perceptions of family belonging are associated with a number of well-being indicators, yet we know little about what factors influence these perceptions or how they differ by family structure. The current study uses nationally representative data from Add Health to examine predictors of adolescents’ perceptions of family belonging in two-biological-parent families (n = 9686). The results are compared to a recent study using Add Health that examined family belonging in married mother-stepfather families. Findings suggest both similarities and differences across family structure in the factors associated with family belonging.
